

## Exercise 1

Write 10 valid lines of Julia code.

Try to use a variety of Julia operators: `=`, `+`, `-`, `*`, `/`, the comma, and Julia delimiters: `"""`, `“`, `()`

Order matters!

These two line of code:

```
mystringexample1
```

```
mystringexample1 = "Hello, World"
```

Will produce an error.\* Try it out!

These two lines of code will not produce an error:

```
mystringexample1 = "Hello, World"
```

```
mystringexample1
```

Try to use the `println` function to print different things. See if you can print some of your valid lines of code. Example: `println(mystringexample1 = "Hello, World")`

Have fun experimenting. Writing code is the best way to learn!

\*In an otherwise empty file or REPL session.
